## MasterCare Electronic Discharge Referral System

MasterCare is a new generation, web-based application, designed to provide clinical services to the point of care throughout the modern large health enterprise. It provides these services in a low bandwidth, low maintenance, low cost and highly reliable 24x7 application architecture.

MasterCare is the tactical solution for hospitals wishing to gain additional value from their plethora of existing information systems. It offers clinicians a range of outstanding clinical tools and provides a strategic platform for the migration to full clinical solutions and an Electronic Medical Record System (EMRS).

One of MasterCare's exciting new modules is the Electronic Discharge Referral System (EDRS) designed to improve all parts of the efficiency (communication) and timeliness of information transfer between a hospital, and a patient's referring clinician and community carers.

MasterCare EDRS is a user-friendly function rich, web-based application. It sits over the top of core hospital systems and brings data from disparate sources together to produce flexible information rich discharge referrals. These discharge referrals can be sent electronically to arrive on the GP's desktop before they see the discharged patient and thereby improving the care of the patient and communication between professional healthcare providers.
